

# Harmonic approximation of optical traps

June 23, 2020

T. Sánchez-Pastor

---

An optical lattice in one spatial direction can be formed by overlapping two counter-propagating laser beams. It can be shown that the potential in this kind of systems depends on:

- The polarizability  $\alpha$ .
- The wavelength of the laser  $k = \frac{2\pi}{\lambda}$ .
- The intensity of the laser in the  $j$ -direction  $I_{o,j}$ .

The potential depth in the  $j$ -direction is defined as follows:

$$V_{0,j} = \frac{-Re(\alpha)}{2c\epsilon_0} \sum_{j=x,y,z} I_{0,j} \sin^2(k_j j). \quad (1)$$

Therefore, the optical lattice potential for a system of two atoms is:

$$V_{oL} = \sum_{i=1,2} \sum_{j=x,y,z} V_{0,j}^{(i)} \sin^2(k_j j_i) \quad (2)$$

The harmonic trap potential is central in this studies and can be obtained by expanding the optical lattice potential in a Taylor Series up to the second order:

$$V_{oL} \approx \sum_{i=1,2} \sum_{j=x,y,z} V_{0,j}^{(i)} k_j^2 j_i^2 \quad (3)$$

In ultracold atoms systems is always required to separate the contributions of the relative motion, the center of mass and the coupling between them. The CM coordinates are:

$$\begin{cases} \vec{r} &= \vec{r}_1 - \vec{r}_2 \\ \vec{R} &= \mu_1 \vec{r}_1 + \mu_2 \vec{r}_2 \end{cases} \quad (4)$$

where,  $\mu_{1,2} = \frac{m_{1,2}}{m_1+m_2}$ . Taking advantage of the symmetry of the spatial variables, we are going to perform this calculation only in one dimension and generalize it to the other two dimensions:

$$V_{oL} = \sum_{i=1,2} V_{0,x}^{(i)} k_x^2 x_i^2 \quad (5)$$

$$\begin{cases} x &= x_1 - x_2 \\ X &= \mu_1 x_1 + \mu_2 x_2 \end{cases} \quad (6)$$

$$x_1 = x + x_2 \rightarrow X = \mu_1 x + x_2(\mu_1 + \mu_2)$$

Hence, using appendix A.1 and A.2:

$$x_2 = X - \mu_1 x \quad (7)$$

$$x_1 = X + x(1 - \mu_1) = X + \mu_2 x \quad (8)$$

We need to calculate an expression for  $x_1^2$  and  $x_2^2$ :

$$x_1^2 = (X + \mu_2 x)^2 = X^2 + \mu_2^2 x^2 + 2xX\mu_2 \quad (9)$$

$$x_2^2 = (X - \mu_1 x)^2 = \underbrace{X^2}_{c.m.} + \underbrace{\mu_1^2 x^2}_{rel} - \underbrace{2xX\mu_1}_{c.m.-rel} \quad (10)$$

Plugging the last equations in eq.5 we obtain the three contributions to the harmonic potential:

$$V_{cm} = \sum_{i=1,2} V_{0,x}^{(i)} k_x^2 X^2 \quad (11)$$

$$V_{rel} = \sum_{i=1,2} V_{0,x}^{(i)} k_x^2 \mu_\eta^2 x^2, \quad \eta = 2, 1 \quad (12)$$

$$V_{c.m.-rel} = 2k_x^2 xX \left[ V_{0,x}^{(1)} \mu_2 - V_{0,x}^{(2)} \mu_1 \right] \quad (13)$$

Finally, for the three spatial dimensions:

$$V_{cm} = \sum_{i=1,2} \sum_{j=x,y,z} V_{0,j}^{(i)} k_j^2 R_j^2 \quad (14)$$

$$V_{rel} = \sum_{i=1,2} \sum_{j=x,y,z} V_{0,j}^{(i)} k_j^2 \mu_\eta^2 r_j^2, \quad \eta = 2, 1 \quad (15)$$

$$V_{c.m.-rel} = 2 \sum_{j=x,y,z} k_j^2 r_j R_j \left[ V_{0,j}^{(1)} \mu_2 - V_{0,j}^{(2)} \mu_1 \right] \quad (16)$$

The discrepancy with Sala's thesis is that the c.m-rel coupling is multiplied by  $\frac{1}{2}$  and not by 2.

## Appendix

**A.1:**  $\mu_1 + \mu_2$

$$\mu_1 + \mu_2 = \frac{m_1}{m_1 + m_2} + \frac{m_2}{m_1 + m_2} = 1$$

**A.2:**  $1 - \mu_1$

$$1 - \mu_1 = 1 - \frac{m_1}{m_1 + m_2} = \frac{m_1 + m_2 - m_1}{m_1 + m_2} = \mu_2$$
